```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

Sequence
                                                        expression
                                                                                                             proteins. These proteins and the nucleic acid encoding them may used in the prevention, diagnosis and treatment of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is encoded by the DLC-1 gene. The gene is a putative tumor suppressor gene which is frequently deleted in liver cancer cells. Detecting deletion of this gene, or absence of the expressed protein, indicates increased susceptibility to cancer, or presence of cancer
                                                                                   associated with inappropriate
                                                                                                                                                                         The present invention relates to 13 human colon cancer-associated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             B
                                                                                              neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders,
                                                gastrointestinal disorders, wounds, repnal disorders, infectious diseases, and cardiovascular disorders. AAC98764 to AAC98772 and AAB54007 represent sequences used in the accomplishment.
                                                                                                                                                                                                                                                                                                                                                              Colon cancer associated gene sequences, referred to as colon cancer antigens, useful for the treatment, prevention, and diagnosis of colon disorders such as colon cancer -

                                                                                                                                                  The specification describes a DNA sequence which partially encodes a functional portion of polypeptide component required for synthesizing the polyketide antibiotic Tel-aviv, postmodification of antibiotic Tel-aviv, or regulation of biosynthesis of antibiotic Tel-aviv. The antibiotic Tel-aviv is a macrocyclic polyketide synthesised through the incorporation of acetate, methionine, and glycine. It inhibits cell wall synthesis by interfering with the polymerisation of the lipid-disaccharide-pentapeptide. Antibiotic Tel-aviv genes are useful in combinatorial genetics, and for encoding protein components for the synthesis, modification and regulation of antibiotic antibiotic Tel-aviv. Antibiotic Tel-aviv is useful in a wide range of clinical applications such as treating gingivitis. Antibiotic Tel-aviv is also useful for generating new biological agents from its secondary metabolites. The present sequence represents a protein involved in synthesis of antibiotic

                                                                                                                                                                                                                                                                                                             The present invention relates to the use of peptides as claudin-mediated cell adhesion modulators. The claudin-2 group of proteins are cadherins, which are membrane glycoproteins involved in cell adhesion. In some situations, cell adhesion occurs at abnormal levels, and these peptides can be used to modulate these levels, and thus treat autoimmune diseases, inflammatory diseases and cancer, and aid wound healing and implant adhesion. In addition, they can also be used to facilitate drug delivery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claudin-2 modulating agent; cell adhesion recognition sequence; CAR sequence; autoimmune disease; inflammatory disease; cancer;

The claudin-2 group of proteins are cadherins, which are membrane glycoproteins involved in cell adhesion. In some situations, cell adhesion occurs at abnormal levels, and these peptides can be used to modulate these levels, and thus treat autoimmune diseases, inflammatory diseases and cancer, and aid wound healing and implant adhesion. In addition, they can also be used to facilitate drug delivery to the desired target site. The present sequence has a cyclic

The claudin-2 group of proteins are cadherins, which are membrane glycoproteins involved in cell adhesion. In some situations, cell adhesion occurs at abnormal levels, and these peptides can be used to modulate these levels, and thus treat autoimmune diseases, inflammatory diseases and cancer, and aid wound healing and implant adhesion. In addition, they can also be used to facilitate drug delivery to the desired target site. The present sequence has a cyclic
                                                                         Antibody modulation of claudin-mediated cell adhesion for increasing vasopermiability, for delivering drugs to tumors and the nervous sysand across the skin - \frac{1}{2}

In addition, they can also be used to facilitate drug delivery the desired target site. The present sequence has a cyclic
                                                                                                           The present invention relates to the use of peptides as claudin-mediated cell adhesion modulators. The claudin-2 group of proteins are cadherins, which are membrane glycoproteins involved in cell adhesion. In some situations, cell adhesion occurs at abnormal levels, and these peptides can be used to modulate these levels, and thus treat autoimmune diseases, inflammatory diseases and cancer, and aid wound healing and implant adhesion. In addition, they can also be used to facilitate drug delivery to the desired target site. The present sequence has a cyclic
                                                                                                                                                                                                                                                            Antibody modulation of claudin-mediated cell adhesion for increasing vasopermiability, for delivering drugs to tumors and the nervous system and across the skin - \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to the use of peptides as claudin-mediated cell adhesion modulators. The claudin-2 group of proteins are cadherins, which are membrane glycoproteins involved in cell adhesion. In some situations, cell adhesion occurs at abnormal levels, and these peptides can be used to modulate these levels, and thus treat autolumnune diseases, inflammatory diseases and cancer, and aid wound healing and implant adhesion. In addition, they can also be used to facilitate drug delivery to the desired target site. The present sequence has a cyclic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claudin-2 modulating agent; cell adhesion recog CAR sequence; autoimmune disease; inflammatory

The claudin-2 group of proteins are cadherins, which are membrane glycoproteins involved in cell adhesion. In some situations, cell adhesion occurs at abnormal levels, and these peptides can be used to modulate these levels, and thus treat autoimmune diseases inflammatory diseases and cancer, and aid wound healing and implant adhesion. In addition, they can also be used to facilitate drug delivery to the desired target site. The present sequence has a cyclic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antibody modulation of claudin-mediated cell adhesion for increasing vasopermiability, for delivering drugs to tumors and the nervous system and across the skin -                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence shows a Helicobacter pylori cytoplasmic protein. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide

                                                                                                                                                                                        AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                   New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2000-237871/20.

                                                                                                                                                                                                                                                                                                The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.

The invention relates to nucleic acid sequences (AAV84411 to AAV8463)
CC encoding human secreted proteins (AAW88534 to AAW88756). The secreted compositing phase sequences are deposited with the ATCC under deposit numbers are composited with the ATCC under deposit numbers compositing recombinant vectors containing the nucleic acid could comprising recombinant vectors containing the nucleic acid couseful for the recombinant production of the secreted couseful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Pathological conditions can be also composed by determining the amount of the new polypeptides in a sample cor by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, neurodegenerative consistences, hepatic and renal disease, lymphomas, inflammation, allergies, cushemic shock, Alzheimer's and cognitive disorders, schizophrenia, coused are also useful for identifying their binding partners. The present sequence represents human secreted protein (see descriptor counters).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel murine nucleic acid sequences encoding to clodin family of tight junction (TJ)-constituting membrane protein can be used in medical field. This sequence represents the clodin 2 protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tight junction-constituting membrane protein clodin family - Antibody modulation of claudin-mediated cell adhesion for increasing vasopermiability, for delivering drugs to tumors and the nervous system
                                                                                                             WPI; 2000-365610/31
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to the use of peptides as claudin-mediated cell adhesion modulators. The claudin-1 group of proteins are cadherins, which are membrane glycoproteins involved in cell adhesion. In some situations, cell adhesion occurs at abnormal levels, and these peptides can be used to modulate these levels, and thus treat autoimmune diseases, inflammatory diseases and cancer, and aid wound healing and implant adhesion. In addition, they can also be used to facilitate drug delivery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antibody modulation of claudin-mediated cell adhesion for increasing vasopermiability, for delivering drugs to tumors and the nervous system and across the skin -                                    The present invention relates to the use of peptides as claudin-mediated cell adhesion modulators. The claudin-3 group of proteins are cadherins, which are membrane glycoproteins involved in cell adhesion. In some situations, cell adhesion occurs at abnormal levels, and these peptides can be used to modulate these levels, and thus treat autoimmune diseases inflammatory diseases and cancer, and aid wound healing and implant adhesion. In addition, they can also be used to facilitate drug delivery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the use of peptides as claudin-mediated cell adhesion modulators. The claudin-1 group of proteins are cadherins, which are membrane glycoproteins involved in cell adhesion. In some situations, cell adhesion occurs at abnormal levels, and these peptides can be used to modulate these levels, and thus treat autoimmune diseases inflammatory diseases and cancer, and aid wound healing and implant adhesion. In addition, they can also be used to facilitate drug delivery to the desired target site. The present sequence has a cyclic
                                                                                                                                                                                   Antibody modulation of claudin-mediated cell adhesion for increasing vasopermiability, for delivering drugs to tumors and the nervous sysand across the skin -
                                                                                                                                                                                                                                                                                                                                03-NOV-1998;

                                                                                                                                                                                                                                                                                                                                                  The present invention relates to the use of peptides as claudin-mediated ceil adhesion modulators. The claudin-3 group of proteins are cadherins, which are membrane glycoproteins involved in cell adhesion. In some situations, cell adhesion occurs at abnormal levels, and these peptides can be used to modulate these levels, and thus treat autoimmune diseases, inflammatory diseases and cancer, and aid wound healing and implant adhesion. In addition, they can also be used to facilitate drug delivery to the desired target site. The present sequence has a cyclic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     03-NOV-1998;

F; 189-218/Region: beta-alpha-beta NAD nucleotide-binding fold F; 40,62,169/Binding site: zinc, catalytic (Cys, His, Cys) #status predicted F; 92,95,98,106/Binding site: zinc, noncatalytic (Cys) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alternate names: class III alcohol dehydrogenase
Nichtenate names: class III alcohol dehydrogenase
Nichtenate names: class III alcohol dehydrogenase
Nichtenate formaldehyde dehydrogenase
Nichtenate formaldehyde dehydrogenase (glutathione) (EC 1.2.1.1)
Cispecies: Escherichia coli
Cispecies: Escherichia coli
Cispecies: Escherichia coli
Cispecies: Escherichia coli
Cispecies: Date: 10-Jul-1992 #sequence_revision 01-May-1998 #text_change 11-Jun-1999
Ciscession: S57525
Nichtenate in S57525
Nichtenate number: S57525

OM protein - protein search, using sw model

Run on: January 14, 2002, 07:40:40; Search time 37.71 Seconds (without alignments) 7.778 Million cell updates/sec

Title:
Perfect score:
Sequence: 09-185908-1H 35 1 wrxxafxg 8

Scoring table: BLOSUM62
Gapop 10.0 , Gapext 0.5

Searched: 100059 seqs, 36664827 residues

Total number of hits satisfying chosen parameters:

100059

Minimum DB seq length: 0 Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 50 summaries

Database : SwissProt_39:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
